

Summit Bechtel Course Guide

Set up shared / collaborative editing with Supabase — step-by-step

Your map is already live on GitHub Pages. **Supabase is a free database** that turns on **collaborative editing** — so everyone on your team who opens the same link sees each other's pins, moves, and edits update live (about one second). This takes about 5 minutes.

Live app: <https://sfc-gh-dfreriks.github.io/bechtel-course-guide/>

Step 1 — Create a free Supabase project

- Go to <https://supabase.com> and click **Start your project**. Sign in (signing in with GitHub is easiest).
- Click **New project**.
- **Name:** bechtel-course-guide (any name is fine).
- **Database password:** click **Generate** and save it somewhere. The app does not use it, but Supabase requires one.
- **Region:** pick one near you (e.g. East US).
- Click **Create new project** and wait about 2 minutes for it to finish setting up.

Step 2 — Create the table (run the schema)

- In the left sidebar, open **SQL Editor**, then click **+ New query**.
- Open the file `supabase/schema.sql` from the project folder, copy **all** of it, and paste it into the editor.
- Click **Run** (bottom-right).
- You should see **Success**. If the last line shows *"already member of publication"*, that is harmless — ignore it.

What this does

Creates the **pois** table that stores every point of interest, opens read/write access for your team, and turns on realtime so edits stream to every connected device.

Step 3 — Copy your two credentials

- In the sidebar, open **Project Settings** (the gear icon), then **API**.
- Copy these two values:

Project URL — looks like:

```
https://abcdefghijklm.supabase.co
```

anon public key — a long string starting with:

```
eyJhbGciOiJI... (this key is safe to share; it is built for browser apps)
```

Step 4 — Send both values to finish setup

Paste the **Project URL** and the **anon public** key back to Dave / Cortex Code. They will:

- Save them as GitHub repo Variables (VITE_SUPABASE_URL and VITE_SUPABASE_ANON_KEY) so the live site goes collaborative.
- Add them to a local `.env.local` for development.
- Redeploy the site.

After that, the status pill at the top of the app changes from **Local only** to **Shared · jamboree**, and every teammate on the link edits the same live map.

Good to know

- The anon key is public by design — it ships inside every browser app, so there is no secret to protect.
- Free tier is plenty for a team tour (500 MB database, unlimited API requests).
- Separate courses: add `?course=crew-1` to the URL — each value is its own shared map (default is `jamboree`).
- Offline still works: the last-synced course is cached on each device, so Drive mode runs with no signal and syncs back later.
- No Supabase? The app simply stays local-only (per-device) — nothing breaks.
